Computer Science & Engineering Student | AI/ML Engineering | Software Engineering

SUMMARY

B.Tech CSE student (VIT Chennai, 9.0/10.0) with an AI/ML internship benchmarking text-classification pipelines to 99.64% and 98.46% accuracy, and five projects spanning offline on-device LLMs, computer vision, and document verification — consistently isolating deterministic, auditable logic from the LLM's decision path in safety- and finance-critical systems.

EXPERIENCE

Summer Intern — Artificial Intelligence & Machine Learning

Jun 2026 – Jul 2026

Indian Institute of Computing and Technology (IICT), Delhi · 45-day AI/ML internship

- **Fake news detection:** engineered an end-to-end text-classification pipeline over 38,605 articles; removed a Reuters-dateline artifact that caused trivial class separation, then benchmarked 5 TF-IDF-based classifiers. Linear SVC reached **99.64% accuracy / 0.9964 F1 / 0.9998 ROC-AUC** on a 7,721-article held-out test set; shipped a CLI inference tool and published to GitHub.
- **Phishing email detection:** developed a classifier over 82,073 emails, combining TF-IDF text features with 7 engineered signals (URL count, urgency-keyword frequency, capitalization ratio, etc.) via MaxAbsScaler, with a leakage-safe pre-vectorization train/test split. Best model (MLP) reached **98.46% accuracy / 98.53% F1 / 0.9986 ROC-AUC** on 16,415 held-out emails; pipeline serialized and published to GitHub.

EDUCATION

B.Tech. Computer Science and Engineering (CSE Core)

Expected Jan 2029

Vellore Institute of Technology (VIT), Chennai · GPA: 9.0 / 10.0

PUBLICATIONS

Mind Mirror: AI-Powered Emotional Journal and Mood Analysis Platform

Manuscript under review

- Contributed to research on a locally hosted emotional-journaling and mood-analysis platform using DistilBERT fine-tuned on GoEmotions for emotion classification, with token-level attribution for interpretability (React/TypeScript + Node.js/Express + FastAPI).
- Reported 70.80% accuracy, 0.5818 macro F1, and 0.7032 weighted F1 on the evaluation set; contributed to model development, experimentation, and evaluation.

MVCRT-Net Based Hybrid Deep Learning Framework for Enhanced Gastrointestinal Disease Classification

Manuscript in preparation

- Designed and implemented MVCRT-Net to address a core limitation of standalone CNN/transformer models — weak discrimination between visually similar GI disease categories — fusing CNN, ResNet-50, and ViT branches via multi-head self-attention on a 5-class Kvasir subset.
- Achieved 95% accuracy against standalone CNN, ResNet-50, and ViT baselines, validated via 5-fold cross-validation and paired statistical significance testing.

PROJECTS

MediGem — Offline AI Health Co-Pilot

medigem.vercel.app · [GitHub](https://github.com)

- Engineered an offline-first AI health co-pilot for rural healthcare workers — fully on-device (Gemma 3:4B) — combining Faster-Whisper speech transcription with multilingual output across Tamil, Hindi, and English.
- Isolated a deterministic Emergency Engine — 11 triage rules across 6 acute categories — outside the LLM's decision path, keeping emergency-triage logic immune to model hallucination.

Provenance — Tamper-Evident Document Verification Registry

Next.js · Express · PostgreSQL · Prisma · [GitHub](#)

- Architected a certificate/document verification registry using an append-only SHA-256 hash chain in Postgres — each record hashes its own content plus the previous record's hash — as a lighter-weight, auditable alternative to a distributed blockchain for this use case.
- Implemented a two-tier trust model — issuer-verified credentials vs. self-uploaded documents with a verification-upgrade path — plus a public GET /verify/:id endpoint for tamper checks.

PromptGuard — AI Security Firewall

TypeScript · Node.js · [GitHub](#)

- Developed an AI security firewall that screens user input for prompt-injection and jailbreak attempts before it reaches a downstream LLM, using a regex/keyword-based detection layer (role-override phrasing, injection markers, known jailbreak templates) as a zero-latency pre-filter.
- Designed the filter as the first stage of a two-stage pipeline: only inputs that pass the cheap heuristic check are forwarded to the main LLM, avoiding the cost and latency of running full generation on inputs that are flagged early.

SafeBuild AI — Construction-Site Safety Computer Vision System

YOLO · ByteTrack · FastAPI · SQLite · WebSockets · [GitHub](#)

- Delivered a real-time PPE-compliance detection pipeline (YOLO + ByteTrack) for construction sites, backed by a FastAPI/SQLite service pushing live updates to four dashboards over WebSockets.
- Devised a software-simulated wearable/rescue alerting layer, choosing ByteTrack over BoT-SORT for tracking and LoRa (865–867 MHz) for the wearable link on speed/range trade-offs.

TaxSense — AI-Assisted Tax-Filing Platform

[taxsense-copilot.vercel.app](#) · [GitHub](#)

- Built an AI-assisted tax-filing platform end-to-end — React/TypeScript/Tailwind frontend (dashboard, document vault, onboarding flow) on a Node.js/Express backend — with the Gemini API converting Form 16 documents into structured tax data for downstream computation.
- Isolated tax computation in a hand-written, deterministic TypeScript engine — slab tables for both regimes, deduction caps, Section 87A rebate, and cess — keeping every calculated figure auditable and independent of the LLM.

SKILLS

Languages: Python, C, C++, Java, SQL, JavaScript, TypeScript

AI/ML: Machine Learning, Deep Learning, NLP, Computer Vision, LLMs, Agentic Systems

Frameworks & Libraries: React, Next.js, Node.js, Express, FastAPI, scikit-learn, Hugging Face Transformers, Ultralytics YOLO, ByteTrack, Google ADK

Databases & Tools: PostgreSQL, SQLite, Prisma (ORM), Git, GitHub, Vercel, WebSockets
